HB vs Nesterov stability boundary
$1-\rho = 1e-06$, $\beta = 3$, $s = 1.5$
$K = 2000$, MA window=50, threshold=0.1
$B = 2^0 \ldots 2^7$, $\eta \in [1e-03, 8e+00]$
HB: empirical max stable $\eta$
HB fit: $\eta \propto B(1-\rho)$
Nesterov: empirical max stable $\eta$
Nesterov fit: $\eta \propto B^{\beta}(1-\rho)$, $\beta = 3$
learning rate stability boundary $\eta$
